# Writing Computer Code in Irish

## Chapter 1

*I can now switch effortlessly between two different  
language formats*

Kind of like switching between Ciarán and Gráinne.

### *The translation table makes it possible*

Just run through the translation table and swap everything over to convert the file.

Trousers = Skirts  
T-Shirt = Bra  
Socks = Stockings  
Runners = Heels

And so forth. One simply uses the conversion file to switch the source code from one language to another.

Like switching from Ciarán to Gráinne.

But what if I now want to switch to Marie Lers?

No problem!

**MÁ x = 1 ANSIN**

Teach = "gorm"

**AR SHLÍ EILE**

Teach = "dearg"

**DEIREADH MÁ**

Here is my code once again. I wrote it as Gráinne. But now I wish to read it as Marie Lors. For that I need a program to convert the computer language commands to French. For example **MÁ** to **SI**, **ANSIN** to **PUIS**, **AR SHLÍ EILE** to **SINON** and **DEIREADH MÁ** to **FIN DE SI**, or however the French wish to define it. It is a very, very simple piece of code to write.

I run this software tool and that translates my code as such:

**SI x = 1 PUIS**

Teach = "gorm"

**SINON**

Teach = "dearg"

**FIN DE SI**

This new source code text file will not compile. However it does allow me to read it as Marie Lors. If I wish to compile it I have to convert it back to English commands. IF, THEN, ELSE.

Now, what about Teach = "gorm" and Teach = "dearg"?

I had better update my conversion file as follows:

Teach = Maison

"gorm" = "bleu"

"dearg" = "rouge"

*Now I can read my code as Marie Lora*

**SI x = 1 PUIS**

Maison = "bleu"

**SINON**

Maison = "rouge"

**FIN DE SI**

*Switching between one language and another is now  
effortless*

I can write code in any language I want to and switch it to any other language whenever I want simply by using a conversion table.

For example let us imagine that I am writing code in Ireland for the American market. I might spend a year writing the code in Irish and then just before sending it to America run the conversion program. I may have written the code in Irish but the American only sees it in English.

Similarly one could have the same code seen by an Irish person, a French person, an Italian person and a Finnish person, all in their own regional languages but still the *same code* in each case.

*It is simply a conversion program to switch from one language to another*

Have one master conversion file with all regional language translations in it. Then one can switch from one language to another effortlessly.

*You might not think that you can understand Spanish  
code*

*But you may find it easier to understand than you think*

*Bedazzled – Colombian drug lord*
